Identifying and observing bad designs

Bad Designs

- ❶ Bad design refers to the creation of products, systems, interfaces, or experiences that are ineffective, inefficient, confusing, or aesthetically displeasing.
- ❷ When a design doesn't take into account the needs, preferences, or behaviors of the intended users, it's likely to be ineffective.
- ❸ Design that fails to serve its intended purpose or function is considered bad.
- ❹ Bad Design, often lacks a clear purpose and can be difficult to understand.
- ❺ Bad Design is visually cluttered and unbalanced, making it difficult for the viewer to focus on the important information.

Bad Design - Example 1

- In this image one is shampoo, and the other is conditioner but having same design.

Bad Design - Example 2

- The design is confusing because both the "up" and "down" elevator buttons are lit, making it unclear which direction the elevator is actually going.

Bad Design - Example 3

- The door handle suggests pulling, but the design may actually require pushing, leading to user confusion.

Bad Design - Example 4

- A lift button that moves up and down can confuse people, which is an example of bad design.

Bad Design - Example 5

- Two toilets are in the corner, making it hard to access both; this is an example of bad design.

Good Design

Good Design

- 1 The design should be visually pleasing and attractive to the target audience..
- 2 It should be easy to understand and use, with intuitive navigation and clear instructions.
- 3 Use size, color, and placement to create a visual hierarchy that guides the user's attention.

Good design - Example 1

- In this image, when the power goes out, using a lamp for studying is a great example of good design.

Good design - Example 2

- A well-designed stapler fits comfortably in the hand, is easy to use, and reliably staples multiple sheets of paper with minimal effort.

Good Design - Example 3

- A good study chair supports your back comfortably and promotes proper posture for long study sessions.

Good Design - Example 4

- With so many types of switches available, it becomes confusing to know which button does what, so a single switch is better.

Good Design - Example 5

- A simple, well-formatted resume without pictures, logos, or icons is more likely to be shortlisted because it looks professional and easy to read.

Feedbacks

Feedbacks

- 1 Feedback refers to the information or response that a system provides to a user's actions, inputs, or interactions.
- 2 Feedback is a crucial element in designing user interfaces and interactions to ensure that users understand the outcome of their actions and can effectively use digital systems.
- 3 It helps users navigate interfaces, make informed decisions, and achieve their goals.

Feedback - Example 1

- Bill receipt feedback

Feedback - Example 2

S.T.A.R Employee

Time to vote for our STAR employee of this month!

Rating

	Job Knowledge	Performance	Helpfulness	
El Conde E				
Matt Sue rttstough				
Edison E ssert				
Kenneth Shedden				

If you can only choose one person, who will it be?

Please Select

And why that person deserves to receive the award?

E-mail

- Survey Form.

Feedback - Example 3

- Rating system.

Feedback - Example 4

- up and down voting system

Feedback - Example 5

- online Review feedback

Constraints

Constraints

- ➊ **Constraints refer to limitations or restrictions that are intentionally designed into user interfaces, systems, or interactions to guide user behavior, prevent errors, and ensure appropriate interactions.**
- ➋ **Constraints are used to shape user actions and decisions in a way that aligns with the intended design and functionality of a system.**
- ➌ **They help users understand how to interact with a system more effectively and reduce the likelihood of mistakes.**

Constraints - Example 1

- Hotspot Data Limit

Constraints - Example 2

- File Size Limit

Constraints - Example 3

- Bread Toaster

Constraints - Example 4

- Normal cell is also an example of constraint

Constraints - Example 5

- Door Knob System.

Jugaad

Jugaad

- 1 **Jugaad refers to creative and resourceful approaches to solving design and interaction challenges**
- 2 **Jugaad involves finding innovative and unconventional solutions using the available resources and technologies.**

Jugaad - Example 1

- A broken clock was fixed by sticking a paper with numbers on it, making it a complete clock again.

Jugaad - Example 2

- Creative Setup

Jugaad - Example 3

- Shower

Jugaad - Example 4

- Hostel jugaad kettle on iron

Jugaad - Example 5

- Wearing a helmet while cutting onions is an example of jugaad.

*Thank
you!*
